

A Guide to Customizing Your Web Theme: **Minimal HTML**

Introduction: Customizing a web theme allows you to personalize its appearance and make it unique to your style and needs. This guide will walk you through the process of modifying various elements of your web theme, including avatar images, gallery images, headings, paragraphs, colors, fonts, icons, content, and images. Additionally, we'll cover the file structure, deployment process, and provide documentation to assist you in customizing and configuring your theme.

Changing the Avatar Image

Locate the "images" folder in the theme's root directory.
Inside the "images" folder, find the "avatar.png" file representing the current avatar image.
Prepare the new avatar image and upload it to the same folder, renaming it to "avatar.png".
By following these steps, the new avatar image will automatically replace the old one and be displayed on your website.

Modifying the Gallery Images

Navigate to the "images" folder.
Inside the folder, you'll find files named "gallery-1.jpg", "gallery-2.jpg", and so on, representing the gallery images.
Prepare the new images you want to use for the gallery and upload them to the "images" folder.
Rename the new image files, replacing the existing gallery image files with the same names.
By following these steps, you can update all the gallery images with your desired visuals.

Changing Headings

Locate the section in your HTML code where the heading you want to modify is located.
Headings are usually defined using the <h1> to <h6> tags.
Identify the specific heading tag (e.g., <h1>, <h2>, <h3>, etc.) that you want to change.
Modify the text content within the opening and closing tags of the heading tag.
Save your changes, and the heading will be updated accordingly.

Modifying Paragraphs

Similar to headings, locate the section in your HTML code where the paragraph you want to modify is located.

Paragraphs are typically defined using the <p> tag.

Find the <p> tag that encloses the text content you wish to change.

Modify the text content within the opening and closing tags of the <p> tag.

Save your changes, and the paragraph text will be updated.

Color Changes

Customize the theme's colors by modifying the color codes in the CSS file.

Colors are usually specified in HEX or RGB format.

Select different colors and update the corresponding codes to create a unique color palette for the theme.

Font Modifications

Change the font used in the theme by updating the font-family property in the CSS file.

Explore different fonts available for the web and select your preferred font to apply it to the theme.

Icons

The theme utilizes the Font Awesome library for icons.

(<https://fontawesome.com/>)

Visit the Font Awesome website to explore different icons.

Copy the corresponding code for the desired icon and use it in the theme.

Customize the size, color, and style of the icons using CSS.

Content Editing

Text content in the HTML file can be easily edited.

Modify headings, paragraphs, list items, and other text-containing HTML elements directly in the HTML file.

Update the text to suit your preferences and customize the theme's content accordingly.

Image Replacements

The theme's images are located in the "images" folder.

Select the desired images and upload them to the "images" folder, replacing the existing ones.

For example, to change the avatar image, save a new image as "avatar.png" and overwrite the existing file.

Apply the same approach to replace gallery images.

File Structure and Deployment

Explain the file structure and organization process.

Establish links between files and ensure proper organization.

Upload the files to a web server using an FTP (File Transfer Protocol) application like FileZilla.

Connect to your hosting account via FTP and transfer the files to the server.

Once the files are uploaded, your updated theme can be published.

Documentation and Guidance

Provide documentation or a guide on customizing and configuring the theme.

Include information on the theme's features, components, and step-by-step instructions for customization.

Refer to this resource to troubleshoot issues and gain a better understanding of the theme.

Domain and Hosting

Users need a domain and hosting to publish their websites on the internet.

The domain represents the website's address, while hosting refers to the server service used to store and make the website's files accessible.

Acquire domain and hosting services from a provider.

Connect to your hosting using an FTP application like FileZilla.

(<https://filezilla-project.org/>)

Upload your theme files to the server using the FTP application.

Publish your website and make it accessible on the internet using your associated domain name.

Edit

You can use Sublime Text to edit all the files. Sublime Text is a user-friendly text editing program with advanced features for various programming languages. Here are the basic steps to edit files using Sublime Text:

Download and Install Sublime Text: Go to the official website of Sublime Text at <https://www.sublimetext.com/> and download the appropriate version for your operating system. Install it on your computer.

Opening Files: Launch Sublime Text and open the folder where the theme files are located. To edit the files, you can either drag and drop the HTML, CSS, and other files into Sublime Text or use the "File" menu and select "Open" to navigate to the files.

Editing Files: Sublime Text provides syntax highlighting, auto-completion, and code editing features for various file types. Select the files and enter the code or text you want to edit. Changes will be saved automatically.

Saving Files: To save the changes you've made to the files, you can use the "File" menu and select "Save" or use the keyboard shortcut Ctrl + S (Windows/Linux) or Command + S (Mac).

Uploading Files: To upload the files with the changes to a web server, you can use FTP or a similar method. Sublime Text may have built-in options or plugins to connect to FTP, or you can use a separate FTP client. Decide on the method of uploading to your web server and follow the relevant steps to upload the files.

Sublime Text is a powerful tool for editing files and customizing web themes. You can use it to make the necessary edits and shape the theme according to your preferences.

By following these instructions, you can easily customize your web theme to match your preferences and create a unique online presence. Remember to save your changes and upload your updated theme to make it live on the internet.

Contact Me: I'm here to assist you with pleasure! If you have any questions or need any help, please feel free to reach out to me. You can contact me at **mail@dogukansahil.dev** I will get back to you as soon as possible and address your inquiries.

I'm excited to help you!
Thanks for your purchase.
